

A Reactive Environment for Network Music Performance

CIRMMT Student Award Presentation

Dalia El-Shimy
Ph.D. Candidate
Supervisor: Prof. Jeremy Cooperstock

McGill University, Shared Reality Lab

September 5, 2012

Overview

1 Introduction and Background

- Network Music Performance
- Approaches for Dealing with Latency
- Reactive Environments
- User-Centered Design

2 Design and Development

- Understanding the User
- System Description
- First Prototype
- Second Prototype
- Alpha System

3 Future Work

4 Discussion

Characteristics of the Network

According to Tanaka:

"Music exists in space, in acoustical contexts, in the environment that it is played in. If music is made on networks, the network infrastructure becomes the space the music occupies. The time characteristic of that infrastructure defines the musical quality of that medium. Network transmission latency thus becomes the acoustic of the network, to be respected and exploited just as one does when composing for specific physical spaces" [Tanaka, 2006]

Approaches for Dealing with Latency

**Latency
Accepting
Approach**

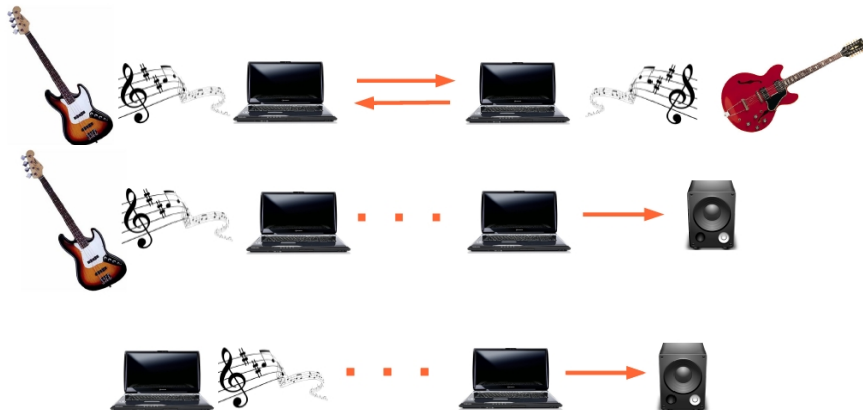

**Best suited to the nature
of the network**

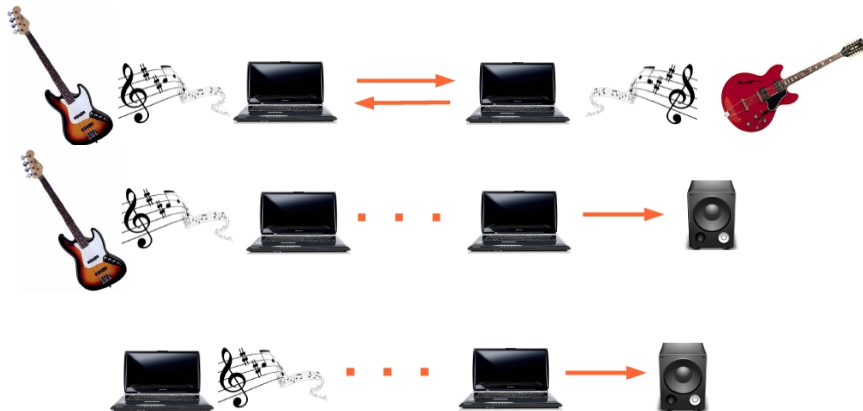

The Big Question

Why not capitalize on the fact that, by definition, the network brings computing technology to the performance setting, and use this to the musicians' advantage by giving them control over certain dynamics of the performance?

Existing Systems

Existing Systems

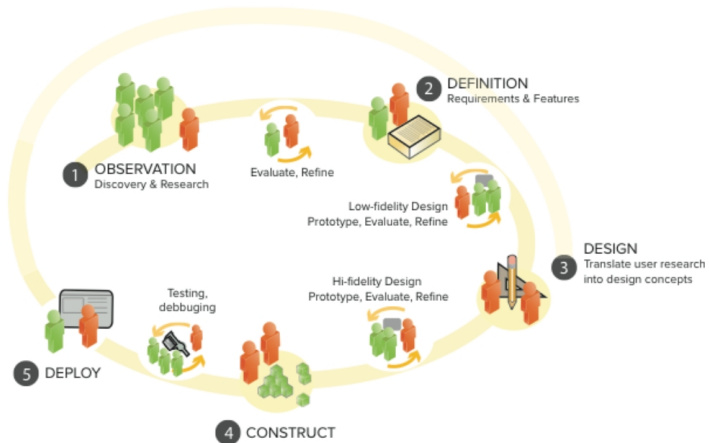

How can the user interact with a system **while** playing an instrument?

Reactive Environments

A Reactive Environment should...

- “reduce the cognitive load of the user by allowing the system to make context-sensitive reactions in response to the users conscious actions” [Cooperstock, 1995]
- “do its job well enough that the occupants are usually not aware of its presence” [Elrod, 1993]

User-Centered Design (UCD)

Our Proposed System

We want to:

- Design a system for NMP that allows musicians to interact with their instruments and their computer-controlled environment simultaneously
- Increase the level of interaction between the distributed musicians
- Apply a user-centered methodology throughout the process

Research Goals

- Create a system that is enjoyable and easy-to-use for musicians
- Examine the merits of UCD when applied to Music Technology
- Draw lessons for interface designers from the HCI community who work with challenging target users

Research Goals

- Create a system that is enjoyable and easy-to-use for musicians
